Traces the workings of the Intelligent Design Movement to challenge theories about Darwinian macroevolution and the accepted naturalistic origin of life, profiling the movement's key contributors and influences to examine both sides of the debate.

When Charles Darwin finished *The Origin of Species*, he thought that he had explained every clue, but one. Though his theory could explain many facts, Darwin knew that there was a significant event in the history of life that his theory did not explain. During this event, the “Cambrian explosion,” many animals suddenly appeared in the fossil record without apparent ancestors in earlier layers of rock. In *Darwin ' s Doubt*, Stephen C. Meyer tells the story of the mystery surrounding this explosion of animal life—a mystery that has intensified, not only because the expected ancestors of these animals have not been found, but because scientists have learned more about what it takes to construct an animal. During the last half century, biologists have come to appreciate the central importance of biological

information—stored in DNA and elsewhere in cells—to building animal forms. Expanding on the compelling case he presented in his last book, *Signature in the Cell*, Meyer argues that the origin of this information, as well as other mysterious features of the Cambrian event, are best explained by intelligent design, rather than purely undirected evolutionary processes.

In the tradition of grand sweeping histories such as *From Dawn To Decadence*, *The Structure of Scientific Revolutions*, and *A History of God*, Hecht champions doubt and questioning as one of the great and noble, if unheralded, intellectual traditions that distinguish the Western mind especially—from Socrates to Galileo and Darwin to Wittgenstein and Hawking. This is an account of the world's greatest 'intellectual virtuosos,' who are also humanity's greatest doubters and disbelievers, from the ancient Greek philosophers, Jesus, and the Eastern religions, to modern secular equivalents Marx, Freud and Darwin—and their attempts to reconcile the seeming meaninglessness of the universe with the human need for meaning. This remarkable book ranges from the early Greeks, Hebrew figures such as Job and Ecclesiastes, Eastern critical wisdom, Roman stoicism, Jesus as a man of doubt, Gnosticism and Christian mystics, medieval Islamic, Jewish and Christian skeptics, secularism, the rise of science, modern and contemporary critical thinkers such as Schopenhauer, Darwin, Marx, Freud, Nietzsche, the existentialists.

The debate between proponents of Darwinism and those of Intelligent Design has reached the status of a full-scale public battle. With stories of qualifying statements about evolution in public school textbooks and the recent 70th anniversary of the Scopes Monkey trial in the news, the question about our origins will not be put to rest. Following up his award-winning *Doubts about Darwin*, Thomas Woodward traces the continuing saga of the ID movement in *Darwin Strikes Back*. Focusing on the emerging key players on both sides--Michael Behe, William Dembski, Kenneth Miller, Robert Pennock, and more--Woodward helps readers navigate the tangled maze of public debate, including anti-ID activism from Christians, and shows them what might be coming next.

Evidence for a purely Darwinian account of human origins is supposed to be overwhelming. But is it? In this provocative book, three scientists challenge the claim that undirected natural selection is capable of building a human being, critically assess fossil and genetic evidence that human beings share a common ancestor with apes, and debunk recent claims that the human race could not have started from an original couple.

An “arresting” and deeply personal portrait that “confront[s] the touchy subject of Darwin and race head on” (*The New York Times Book Review*). It’s difficult to overstate the profound risk Charles Darwin took in publishing his theory of evolution. How and why would a quiet, respectable gentleman, a pillar of his parish, produce one of the most radical ideas in the history of human thought? Drawing on a wealth of manuscripts, family letters, diaries, and even ships’ logs, Adrian Desmond and James Moore have restored the moral missing link to the story of Charles Darwin’s historic achievement. Nineteenth-century apologists for slavery argued that blacks and whites had originated as separate species, with whites created superior. Darwin, however, believed that the races belonged to the same human family. Slavery was therefore a sin, and abolishing it became Darwin’s sacred cause. His theory of evolution gave a common ancestor not only to all races, but to all biological life. This “masterful” book restores the missing moral core of Darwin’s evolutionary universe, providing a completely new account of how he came to his shattering theories about human

In a book that is both groundbreaking and accessible, Daniel C. Dennett, whom Chet Raymo of *The Boston Globe* calls "one of the most provocative thinkers on the planet," focuses his unerringly logical mind on the theory of natural selection, showing how Darwin's great idea transforms and illuminates our traditional view of humanity's place in the universe. Dennett vividly describes the theory itself and then extends Darwin's vision with impeccable arguments to their often surprising conclusions, challenging the views of some of the most famous scientists of our day.

Biodiversity—the genetic variety of life—is an exuberant product of the evolutionary past, a vast human-supportive resource (aesthetic, intellectual, and material) of the present, and a rich legacy to cherish and preserve for the future. Two urgent challenges, and opportunities, for 21st-century science are to gain deeper insights into the evolutionary processes that foster biotic diversity, and to translate that understanding into workable solutions for the regional and global crises that biodiversity currently faces. A grasp of evolutionary principles and processes is important in other societal arenas as well, such as education, medicine, sociology, and other applied fields including agriculture, pharmacology, and biotechnology. The ramifications of evolutionary thought also extend into learned realms traditionally reserved for philosophy and religion. The central goal of the *In the Light of Evolution (ILE)* series is to promote the evolutionary sciences through state-of-the-art colloquia—in the series of Arthur M. Sackler colloquia sponsored by the National Academy of Sciences—and their published proceedings. Each installment explores evolutionary perspectives on a particular biological topic that is scientifically intriguing but also has special relevance to contemporary societal issues or challenges. This tenth and final edition of the *In the Light of Evolution* series focuses on recent developments in phylogeographic research and their relevance to past accomplishments and future research directions.
